Table 1: **SPIM system calls**

Call code (\$v0)	Service	Arguments	Returns	Notes
1	Print integer	\$a0 = value to print	-	value is signed
4	Print string	\$a0 = address of string to print	-	string must be terminated with '\0'
5	Input integer	-	\$v0 = entered integer	value is signed
8	Input string	\$a0 = address to store string at \$a1 = maximum number of chars	-	returns if \$a1-1 characters or Enter typed, the string is terminated with '\0'
9	Allocate memory	\$a0 = number of bytes	\$v0 = address of first byte	-
10	Exit	-	-	ends simulation

Table 2: **General-purpose registers**

Number	Name	Purpose
R00	\$zero	provides constant zero
R01	\$at	reserved for assembler
R02, R03	\$v0, \$v1	system call code, return value
R04–R07	\$a0--\$a3	system call and function arguments
R08–R15	\$t0--\$t7	temporary storage (caller-saved)
R16–R23	\$s0--\$s7	temporary storage (callee-saved)
R24, R25	\$t8, \$t9	temporary storage (caller-saved)
R26, R27	\$k0, \$k1	reserved for kernel code
R28	\$gp	pointer to global area
R29	\$sp	stack pointer
R30	\$fp	frame pointer
R31	\$ra	return address

Table 3: **Assembler directives**

.data	assemble into data segment
.text	assemble into text (code) segment
.byte b1[, b2, ...]	allocate byte(s), with initial value(s)
.half h1[, h2, ...]	allocate halfword(s), with initial value(s)
.word w1[, w2, ...]	allocate word(s) with initial value(s)
.space n	allocate n bytes of uninitialized, unaligned space
.align n	align the next item to a 2 ⁿ -byte boundary
.ascii "string"	allocate ASCII string, do not terminate
.asciiz "string"	allocate ASCII string, terminate with '\0'

Table 4: **Function calling convention**

On function call:

Caller: saves temporary registers on stack passes arguments on stack calls function using <code>jal fn_label</code>	Callee: saves \$ra and \$fp on stack copies \$sp to \$fp allocates local variables on stack
---	---

On function return:

Callee: sets \$v0 to return value clears local variables off stack restores saved \$fp and \$ra off stack returns to caller with <code>jr \$ra</code>	Caller: clears arguments off stack restores temporary registers off stack uses return value in \$v0
--	---

Table 5: **Instruction Set**

A partial instruction set is on the next page. The following conventions apply.

Instruction Format

Rsrc, Rsrc1, Rsrc2: source operand(s), - must be a register value(s)

Src2; source operand - may be an immediate value or a register value

Rdest: destination, must be a register

Imm: Immediate value, may be 32 or 16 bits

Imm16: Immediate 16-bit value

Addr: Address in the form: offset(Rsrc) ie. absolute address = Rsrc + offset

label: label of an instruction

★: pseudoinstruction

Immediate Form -: no immediate form, or this is the immediate form

★: immediate form synthesized as pseudoinstruction

Unsigned form (append 'u' to instruction name):

- : no unsigned form, or this is the unsigned form

Table 6: MIPS instruction set
